

Gyrolok® Flareless Tube Fittings Tubing Data Charts

Design

HOKE Gyrolok Flareless Tube Fittings have been carefully designed and manufactured to provide a wide range of outstanding leak-tight application capabilities. HOKE Gyrolok® ratings and specifications are as follow:

Pressure Ratings

HOKE Gyrolok fittings are rated for working pressures higher than the tubing recommended for use with Gyrolok®. However, tubing should not be used above its maximum allowable working pressure.

Maximum allowable working pressures for tubing suitable for use with Gyrolok are identified herein. If no pressure is identified for a given size and a wall thickness, then that tube size/wall combination is not suitable for use with Gyrolok® fittings. See caution below.

Vacuum Rating

HOKE Gyrolok offers excellent vacuum capability. With good quality tubing, Gyrolok® fittings will be leak-tight at vacuum levels of 10^{-9} torr while tested with a leakage sensitivity of 10^{-9} sccs.

Materials

HOKE Gyrolok fittings are available in brass, 304 and 316 stainless steel, Monel®, Hastelloy®, Inconel®, titanium, 2205 Duplex, and 254 SMO. Contact your local HOKE distributor for further information.

Tubing

Fully annealed tubing to the specifications identified herein are suitable for use with HOKE Gyrolok® fittings.

The tubing selected, whether metallic or nonmetallic should be compatible with the process fluid, temperature and applications. The wall thickness selections should be based on pressure and temperature conditions.

Tubing should always be fully annealed. While welded tubing may be used with Gyrolok, inconsistencies in its manufacture and performance are sometimes encountered. As a result we recommend the use of seamless tubing.

For proper fitting performance, the tubing surface finish should be good, free from nicks or scratches. Do not use out of round tubing which does not easily go through fitting components.

Fitting performance is maximized when tube ends are squarely cut, using a tubing cutter, and deburred.

Proper fitting performance demands that the fitting be significantly harder than the tubing on which it is used. For example, stainless steel tubing should never exceed a maximum surface hardness of Rockwell B90, while Monel® tubing should never exceed a maximum surface hardness of Rockwell B75.

Accurate surface hardness measurements can be made using many different methods. The HOKE standard is to use the Vickers method, using a Leitz miniload tester with a load between 300 and 500 grams, dependent on wall thickness and surface conditions with a maximum reading of HV185 for stainless steel and HV138 for Monel®.

Gas Service

Gases (air, hydrogen, nitrogen, etc.) can escape through smaller leak paths than liquids. As such, the reduction of surface defects (scratches) on tubing becomes more important when the system media contains gases. As tubing wall thickness increases, the ability of the ferrules to coin out imperfections increases. The use of heavier wall tubing will help the ferrules to overcome minor surface defects that could contribute to gas leakage. Hoke recommends the following minimum wall thickness for tubing when system media contains gases.

TUBE OD (inches)	NOMINAL MINIMUM WALL THICKNESS (inches)	TUBE OD (inches)	NOMINAL MINIMUM WALL THICKNESS (inches)
1/8	0.028	3/4	0.065
3/16	0.028	7/8	0.083
1/4	0.028	1	0.083
5/16	0.035	1 1/4	0.109
3/8	0.035	1 1/2	0.134
1/2	0.049	2	0.180

Suggested Allowable Pressure Tables

Figures and tables are for reference only. HOKE makes no implication that these valves can be used for design work. Applicable codes and practices in industry should be reviewed and considered. ASME Codes are the successor to and replacement of ASA Piping Codes. For combinations not shown, consult factory.

Gyrolok®

Calculating Yield, Burst, and Maximum Allowable Working Pressures

Maximum allowable stress values and calculation factors are used to determine yield, burst, and maximum allowable working pressures. HOKE has made these calculations for a variety of materials and included the results in charts beginning on page 6. The following information is presented to provide an understanding of how the numbers are derived.

Formulas

1. Maximum Allowable Working Pressure

Fractional: Factor \times Maximum Allowable Stress Value (psi)
Metric: Factor \times Maximum Allowable Stress Value (psi) \times 0.06895
Factor \times Maximum Allowable Stress Value (ksi) \times 68.95

2. Calculated Yield Pressure

Fractional: Factor \times Minimum Yield Strength (psi)
Metric: Factor \times Minimum Yield Strength (psi) \times 0.06895

3. Calculated Burst Pressure

Fractional: Factor \times Minimum Tensile Strength (psi)
Metric: Factor \times Minimum Tensile Strength (psi) \times 0.6895

See table of "Maximum Allowable Stress Values for Material at Various Temperatures" on pages 3 and 4, and the "Calculation Factor Tables" on page 5.

Maximum Allowable Working Pressure Calculation Examples

The values listed on the "CALCULATION FACTOR TABLE" are for stainless steel and may be used to determine the maximum allowable pressure, yield pressure, burst pressure or any other pressure for which a stress value is available. The Calculation Factor Tables on page 5 are based on stainless steel tubing having maximum allowable outside diameter and minimum allowable wall thickness. Stress values may be obtained from "MAXIMUM ALLOWABLE STRESS VALUES FOR MATERIALS AT VARIOUS TEMPERATURES" table or other sources. All of the charts contained herein are based on use of tubing having the "worst" tolerance conditions allowed for that particular material.

Example 1

Suppose that you want to know the maximum allowable working pressure of 304 S. ST. seamless, ASTM A-213, 1/4" O.D. by .035 wall tubing at a temperature of 100° F. This information can be directly obtained from the table "MAXIMUM ALLOWABLE WORKING PRESSURE – 304 STAINLESS STEEL" or calculated as follows:

First Find the factor (K) corresponding to 1/4" O.D. \times 0.035 wall on the "CALCULATION FACTOR TABLE".

$$K = 0.2753$$

Second Find the allowable stress (S_A) for seamless 304 stainless steel tubing at 100° F on the "MAXIMUM ALLOWABLE STRESS VALUES FOR MATERIALS AT VARIOUS TEMPERATURES".

$$S_A = 18,750 \text{ psi}$$

Third According to "CALCULATION FACTOR TABLE", Maximum Allowable Working Pressure (P_A) = Factor (K) \times Maximum Allowable Stress (S_A) Value in psi

$$\text{Therefore: } P_A = K \times S_A \\ P_A = 0.2753 \times 18,750 \text{ psi}$$

$P_A = 5161 \text{ psi}$ (Max. Allowable Working Pressure at 100° F)

Example 2

Suppose that you want to know the maximum allowable working pressure of 304 stainless steel seamless, ASTM A-213, 6mm O.D. by 1.2mm wall tubing at a temperature of 38° C. This information can be directly obtained from the table "MAXIMUM ALLOWABLE WORKING PRESSURE – 304 STAINLESS STEEL" or calculated as follows:

First Find the factor (K) corresponding to 6mm O.D. \times 1.2mm wall on the "CALCULATION FACTOR TABLE".

$$K = 0.4112$$

Second Find the allowable stress (S_A) for seamless 304 stainless steel tubing at 38° C on the "MAXIMUM ALLOWABLE STRESS VALUES FOR MATERIALS AT VARIOUS TEMPERATURES".

$$S_A = 18,750 \text{ psi}$$

Third According to "CALCULATION FACTOR TABLE", Maximum Allowable Working Pressure (P_A) = Factor (K) \times Maximum Allowable Stress (S_A) Value in psi \times 0.06895

$$\text{Therefore: } P_A = K \times S_A \times 0.06895 \\ P_A = .4112 \times 18,750 \text{ psi} \times 0.06895$$

$P_A = 532 \text{ bar}$ (Max. Allowable Working Pressure at 38° C)

CAUTION: Limited test data is available on certain materials, including Hastelloy®, Inconel®, 2205 Duplex, and 254 SMO. In such applications, further testing either by HOKE or by the user is recommended to assure fitting suitability for the application.

CIRCOR

Instrumentation Technologies

Our Company

CIRCOR Instrumentation Technologies (CIT) is the logical choice for fluid control solutions. We provide the lowest cost of ownership, offering the best in class reliability and availability of our products. We have global coverage, delivering value in the form of local, flexible service to meet our customer's needs. CIT is a product group specializing in instrumentation with orifice sizes typically up to 2".

Our corporate head office and ISO 9001:2000 registered manufacturing facilities are located at 405 Centura Court, Spartanburg, SC, USA, 29303
Tel +1-864-574-7966 • Fax +1-864-587-5608
